

Inequality and Economic History

EINITE – ERC Starting Grant

Guido Alfani

DONDENA

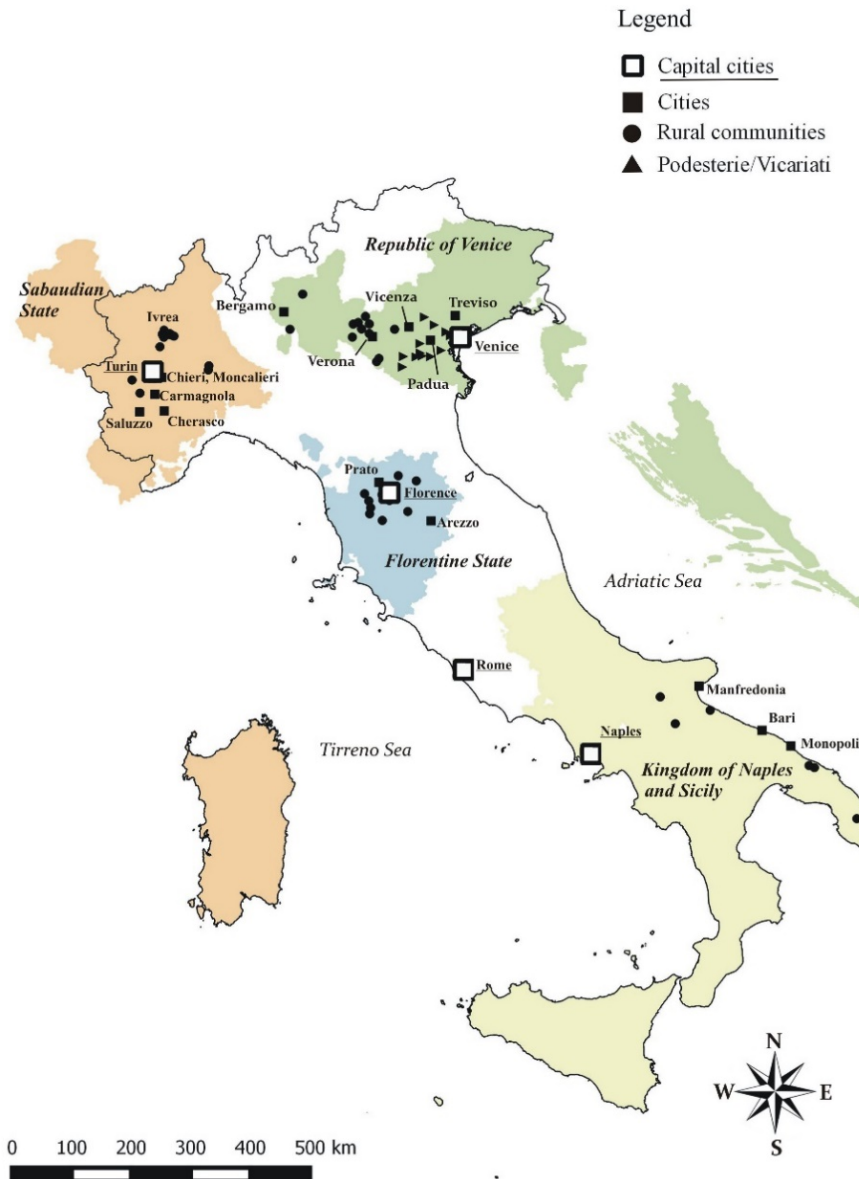

Centre for Research on Social Dynamics
Bocconi University, Milan, Italy

12 October 2017

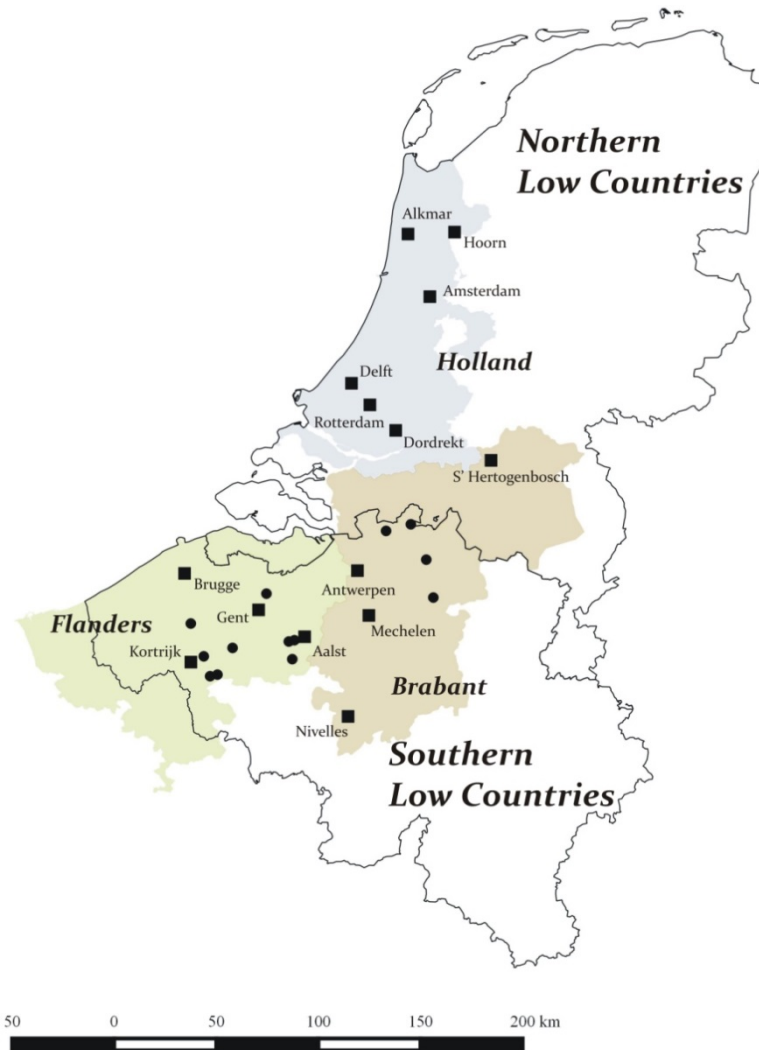

The story so far

- Up until recently, we had very little information about long-term trends in economic inequality in preindustrial Europe. The notable exception was Van Zanden (1995) on Holland in the Low Countries
- The situation has now changed entirely, and for many European regions we now have time series of (mostly wealth) inequality covering the early modern period and part of the Middle Ages
- Most of the new data which has become available is the result of a project funded by the ERC (Starting Research Grant program): **EINITE – Economic Inequality across Italy and Europe, 1300-1800** (www.dondena.unibocconi.it/EINITE)
- Including the preindustrial period in the analysis tends to **change the way in which we look at recent developments in inequality**

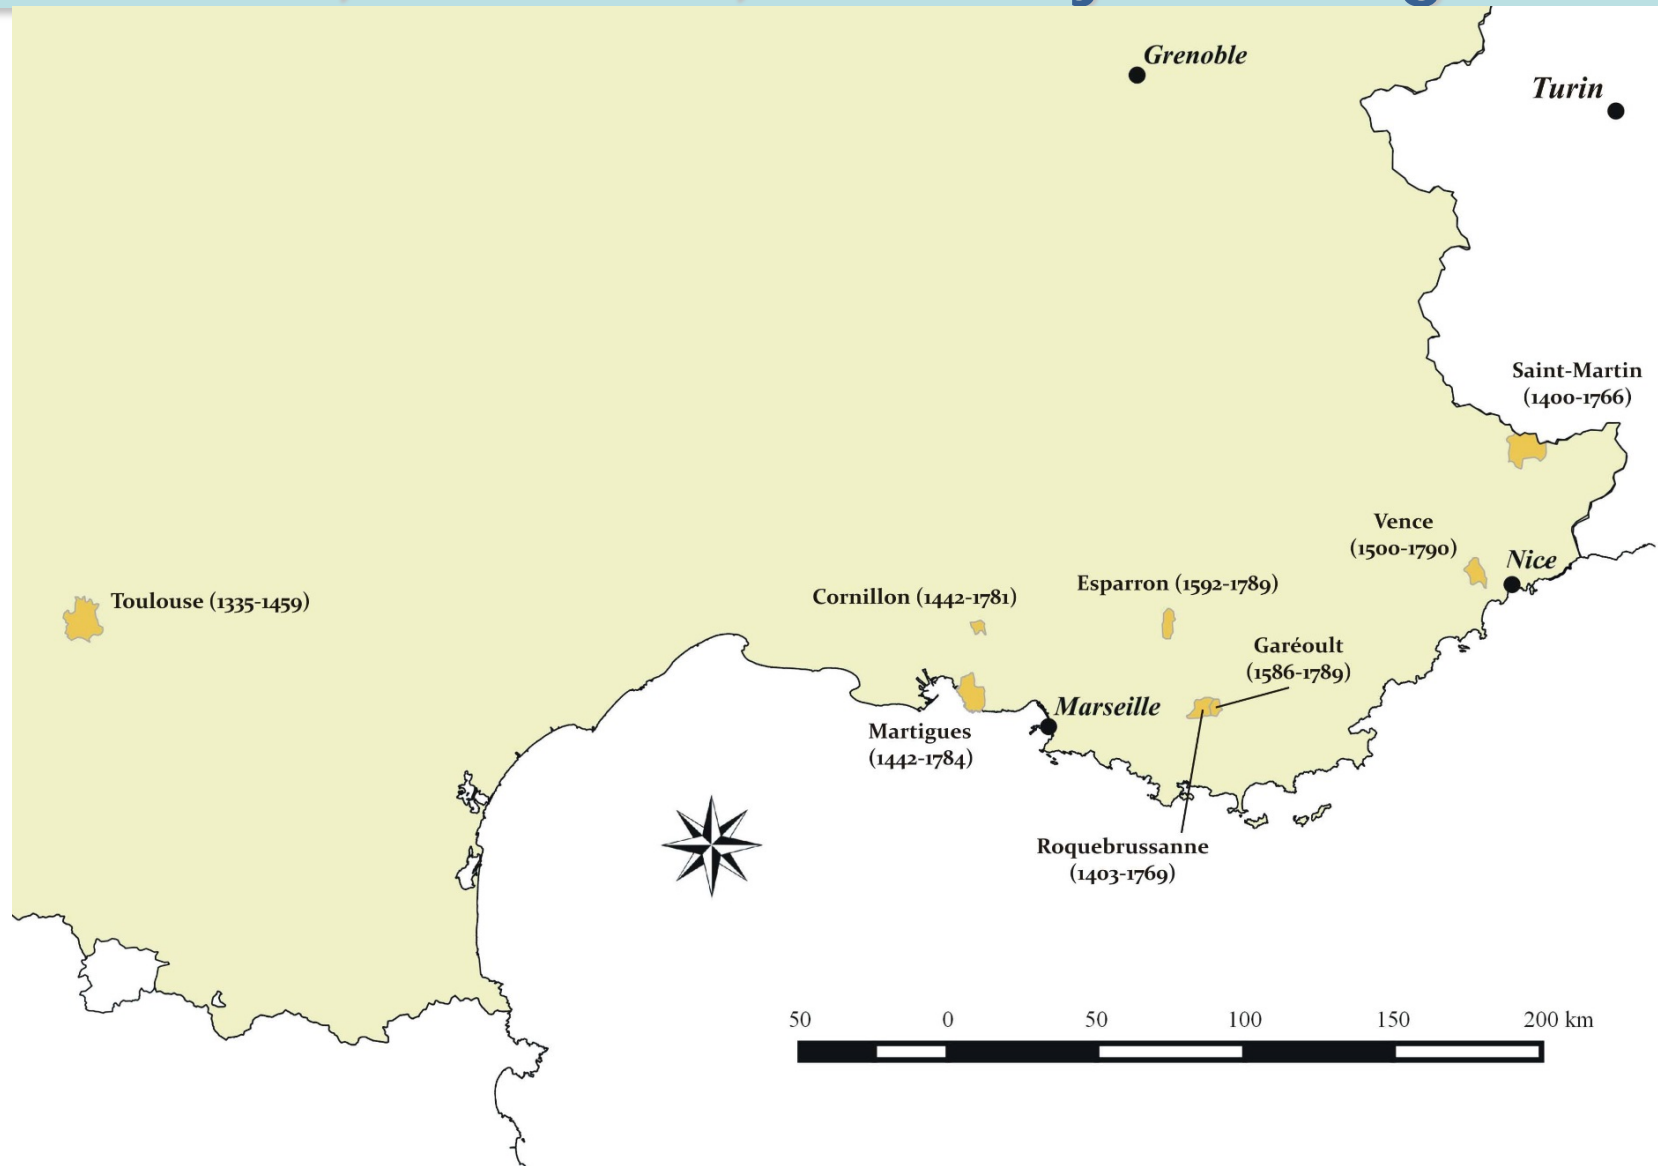

The areas covered by ElnITE: Italy...

...the Low Countries...

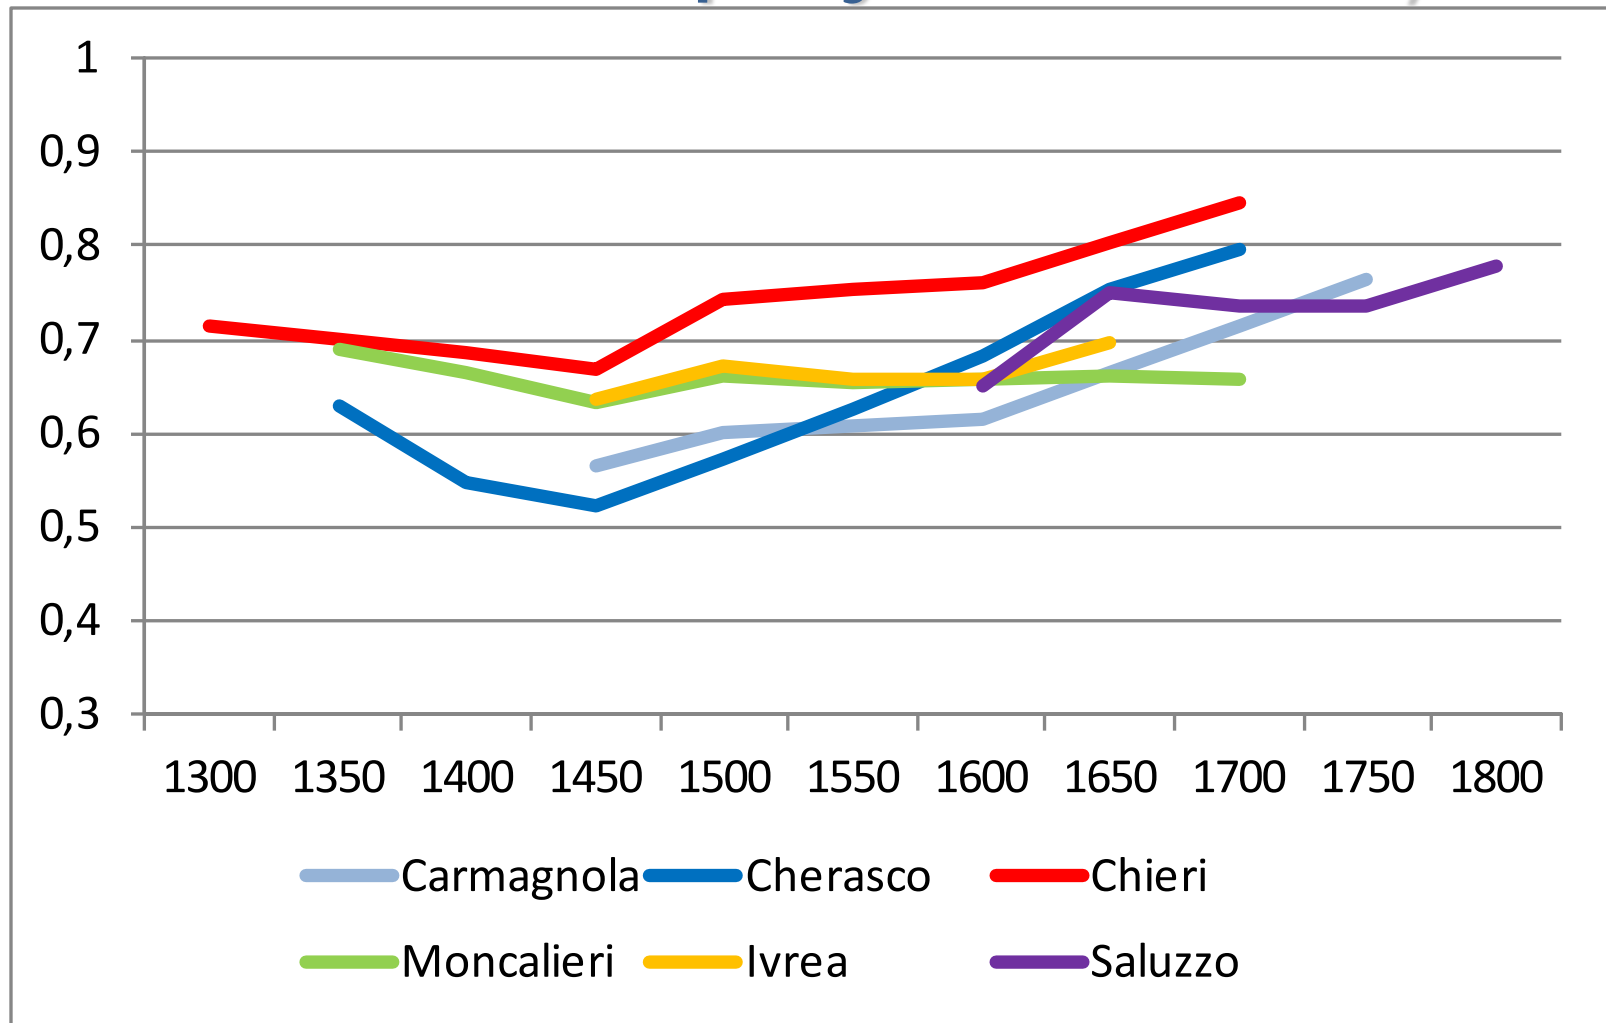

...and other European areas, in particular south France, Catalonia, Germany and England

The Republic of Venice

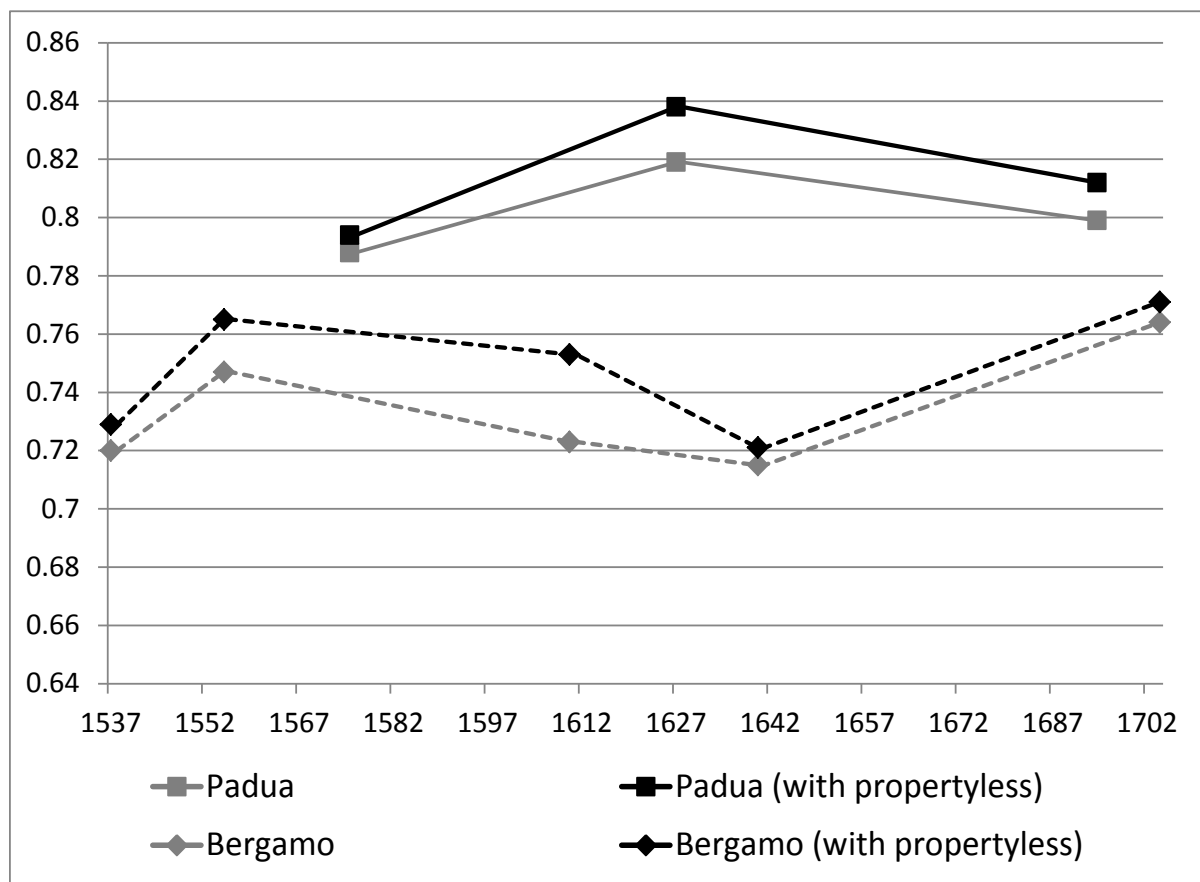

Economic inequality across the Republic of Venice as a whole (wealth inequality, Gini indexes. Propertyless excluded)

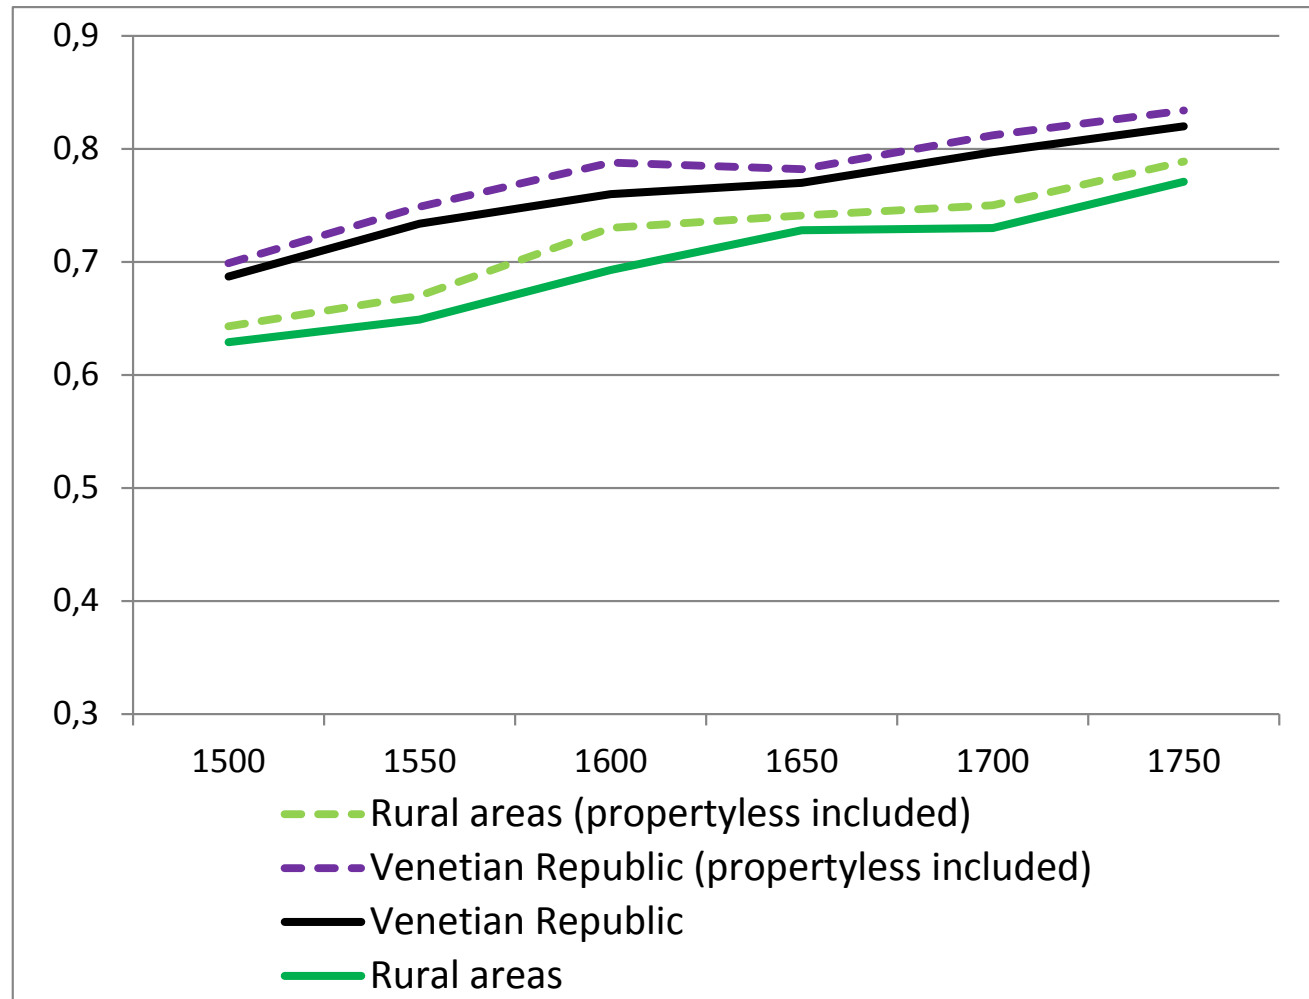

Aggregate series elaborated with the same method introduced in G. Alfani, "Economic inequality in northwestern Italy: A long-term view (fourteenth to eighteenth centuries)", *Journal of Economic History*, 2015

Long-term trends in economic inequality (Gini indexes of wealth concentration, including and excluding the propertyless)

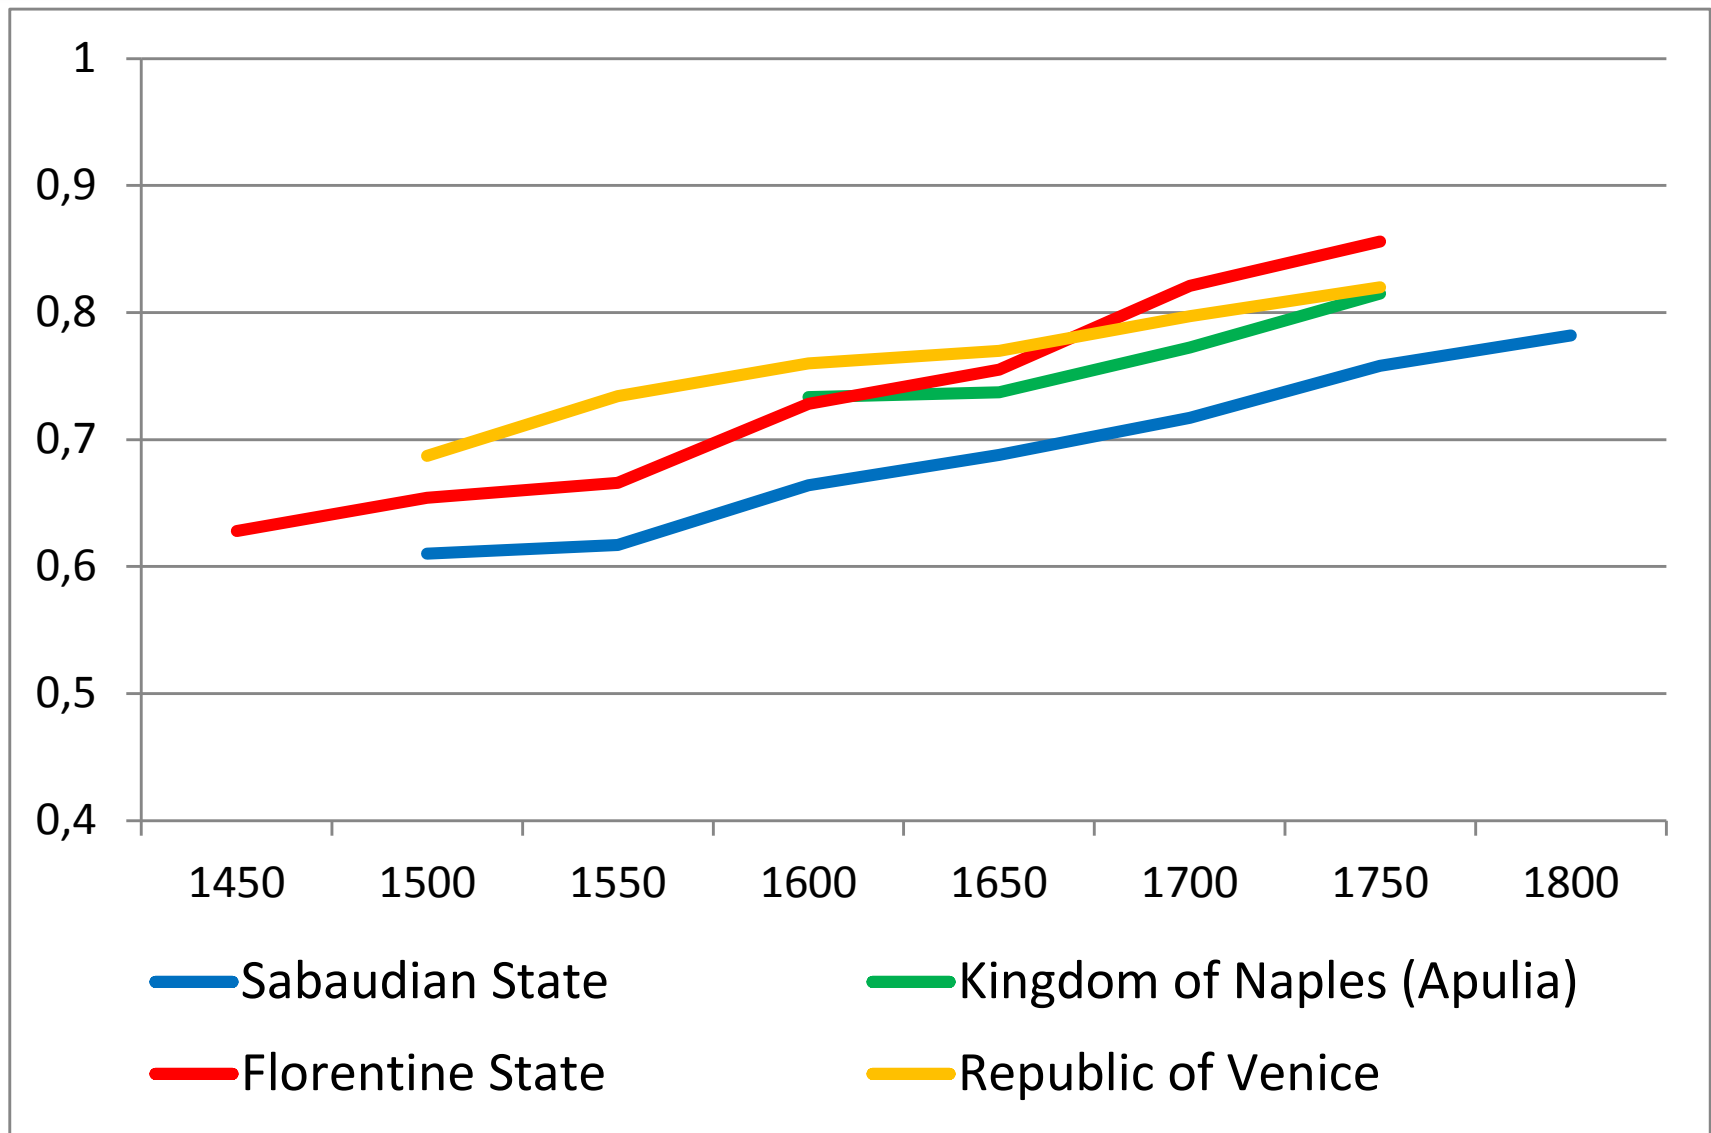

For the rural areas: in Padua's *contado*, where the propertyless were recorded in 1642 and 1694 only, adding them to the distribution increases the Gini index by 1.1% (from 0.728 to 0.736) and by 2.5% (from 0.747 to 0.766) respectively

Economic inequality across the Republic of Venice as a whole (Gini indexes of wealth concentration)

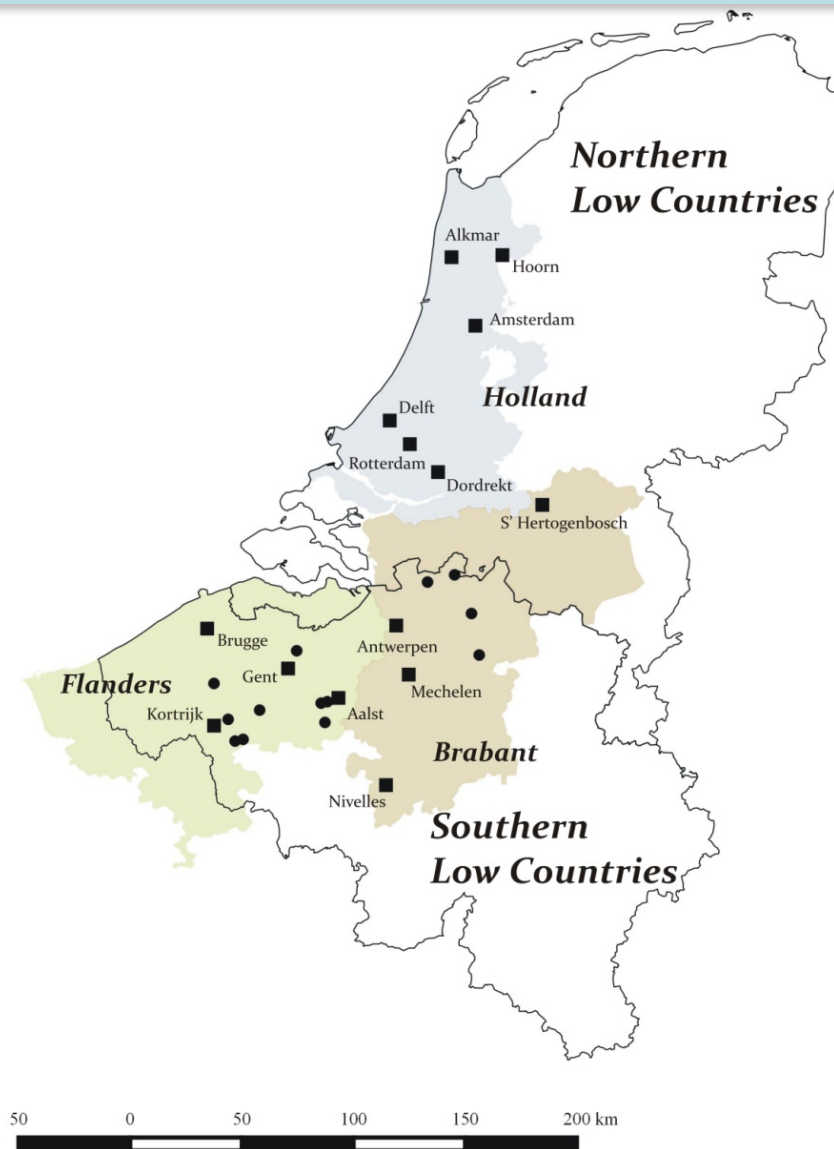

Aggregate series elaborated with the same method introduced in G. Alfani, “Economic inequality in northwestern Italy: A long-term view (fourteenth to eighteenth centuries)”, *Journal of Economic History*, 2015

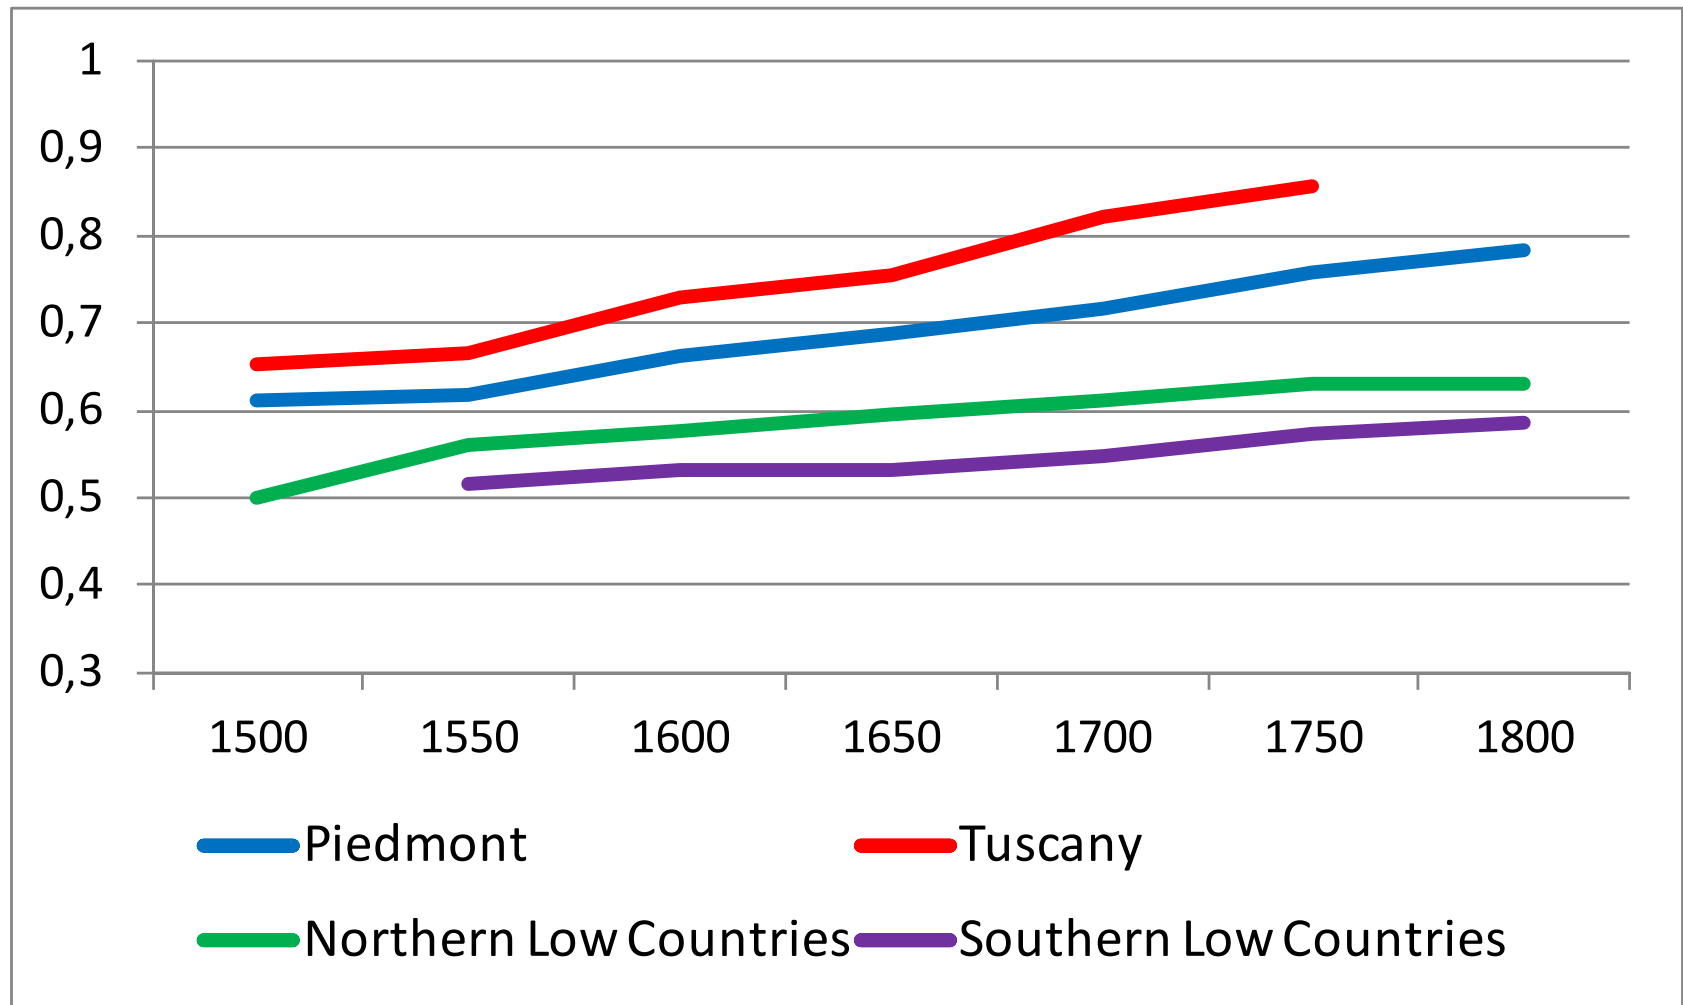

Comparing regional trends in Italy: Republic of Venice, Sabaudian State, Kingdom of Naples and Florentine state (for now!)

Taking the comparison beyond Italy: the Low Countries

Regional trends in inequality (Gini)

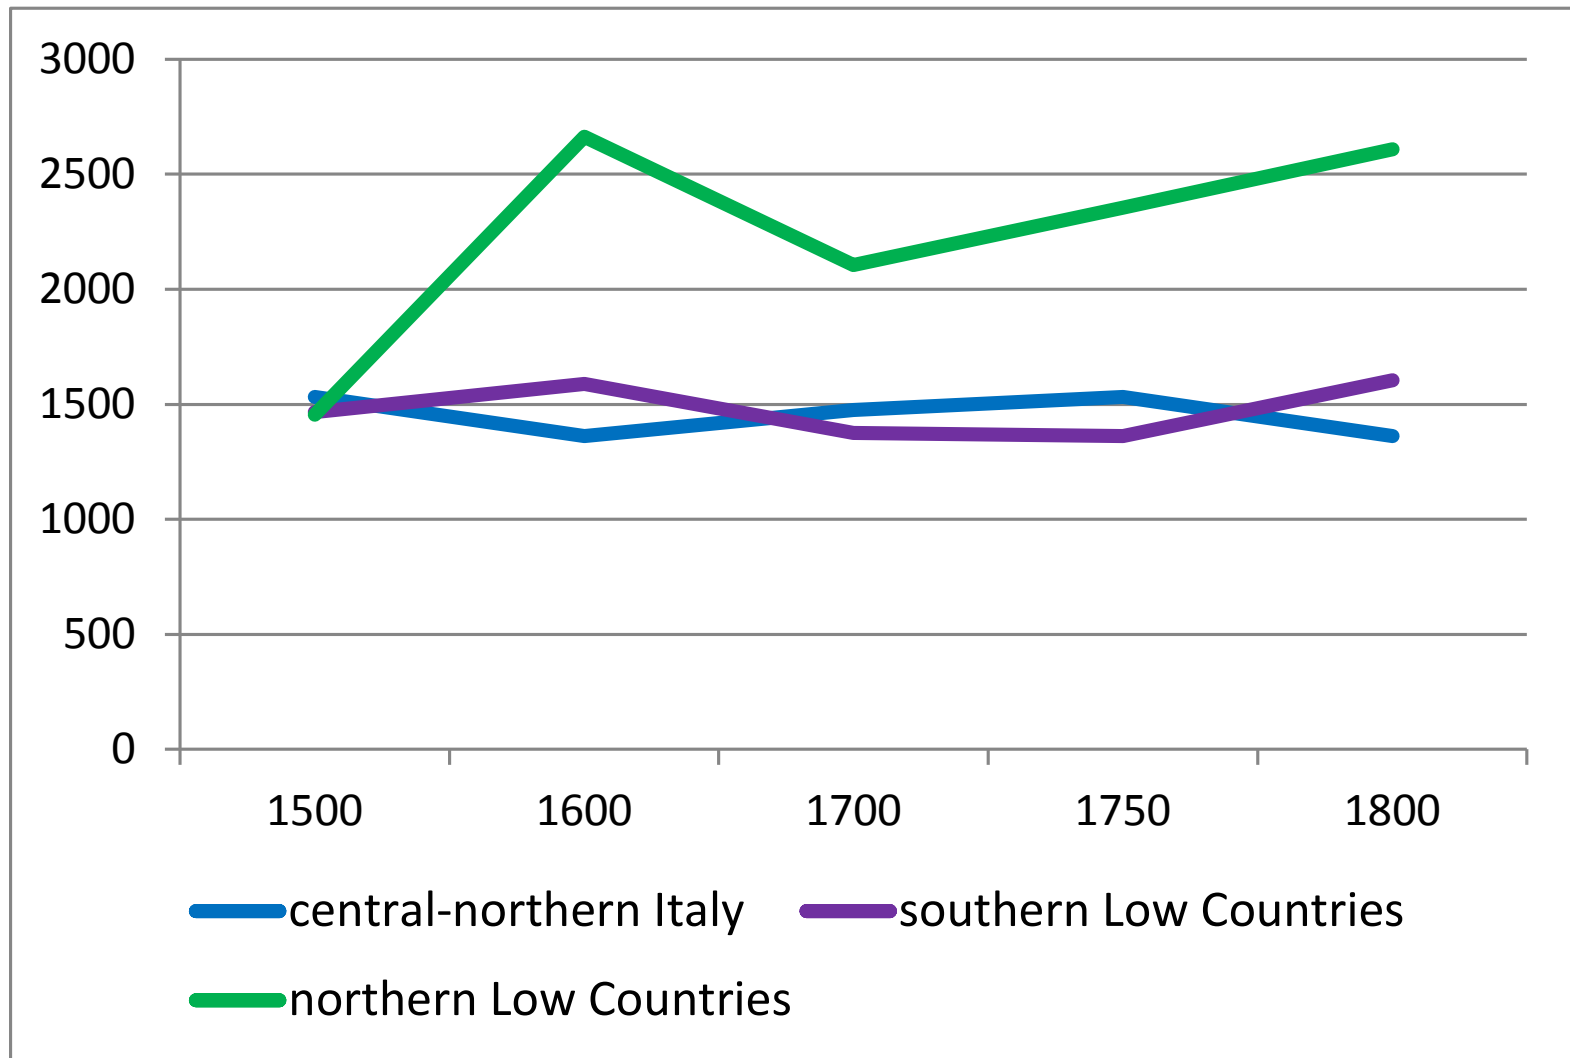

Source: Alfani and Ryckbosch, "Growing apart in early modern Europe? A comparison of inequality trends in Italy and the Low Countries, 1500–1800", *Explorations in Economic History*, 2016

Possible explanations

- Across four different States, on both sides of the Little Divergence, **we find empirically a broadly similar path** of increase in economic inequality throughout the Early Modern period
- As it seems, **no single causal factor can explain all four cases** (plus Apulia and Veneto) for the whole period: this means there was no «necessary» condition to have inequality increase, but **possibly a range of «sufficient» conditions**. We are considering the following:
 - Economic growth
 - Demographic factors (urbanization)
 - Proletarianization
 - Institutions and politics (extraction of inequality)

GDP per capita

Source: Maddison Project (2014)

Politics, institutions, & inequality extraction

Extraction of inequality: the northern Low Countries...

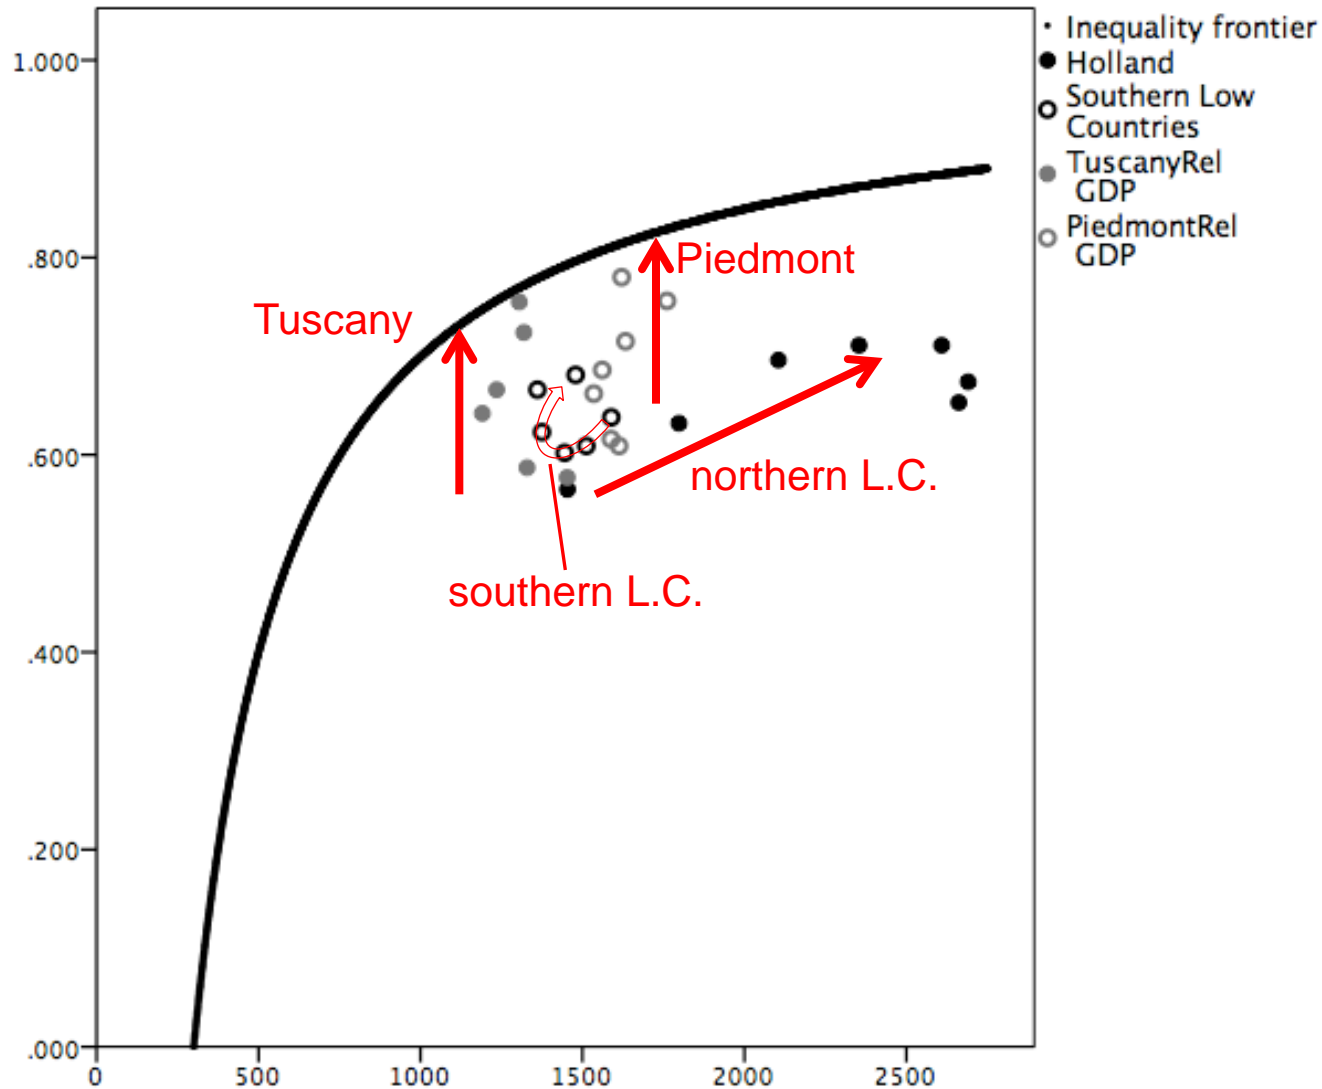

... and Tuscany

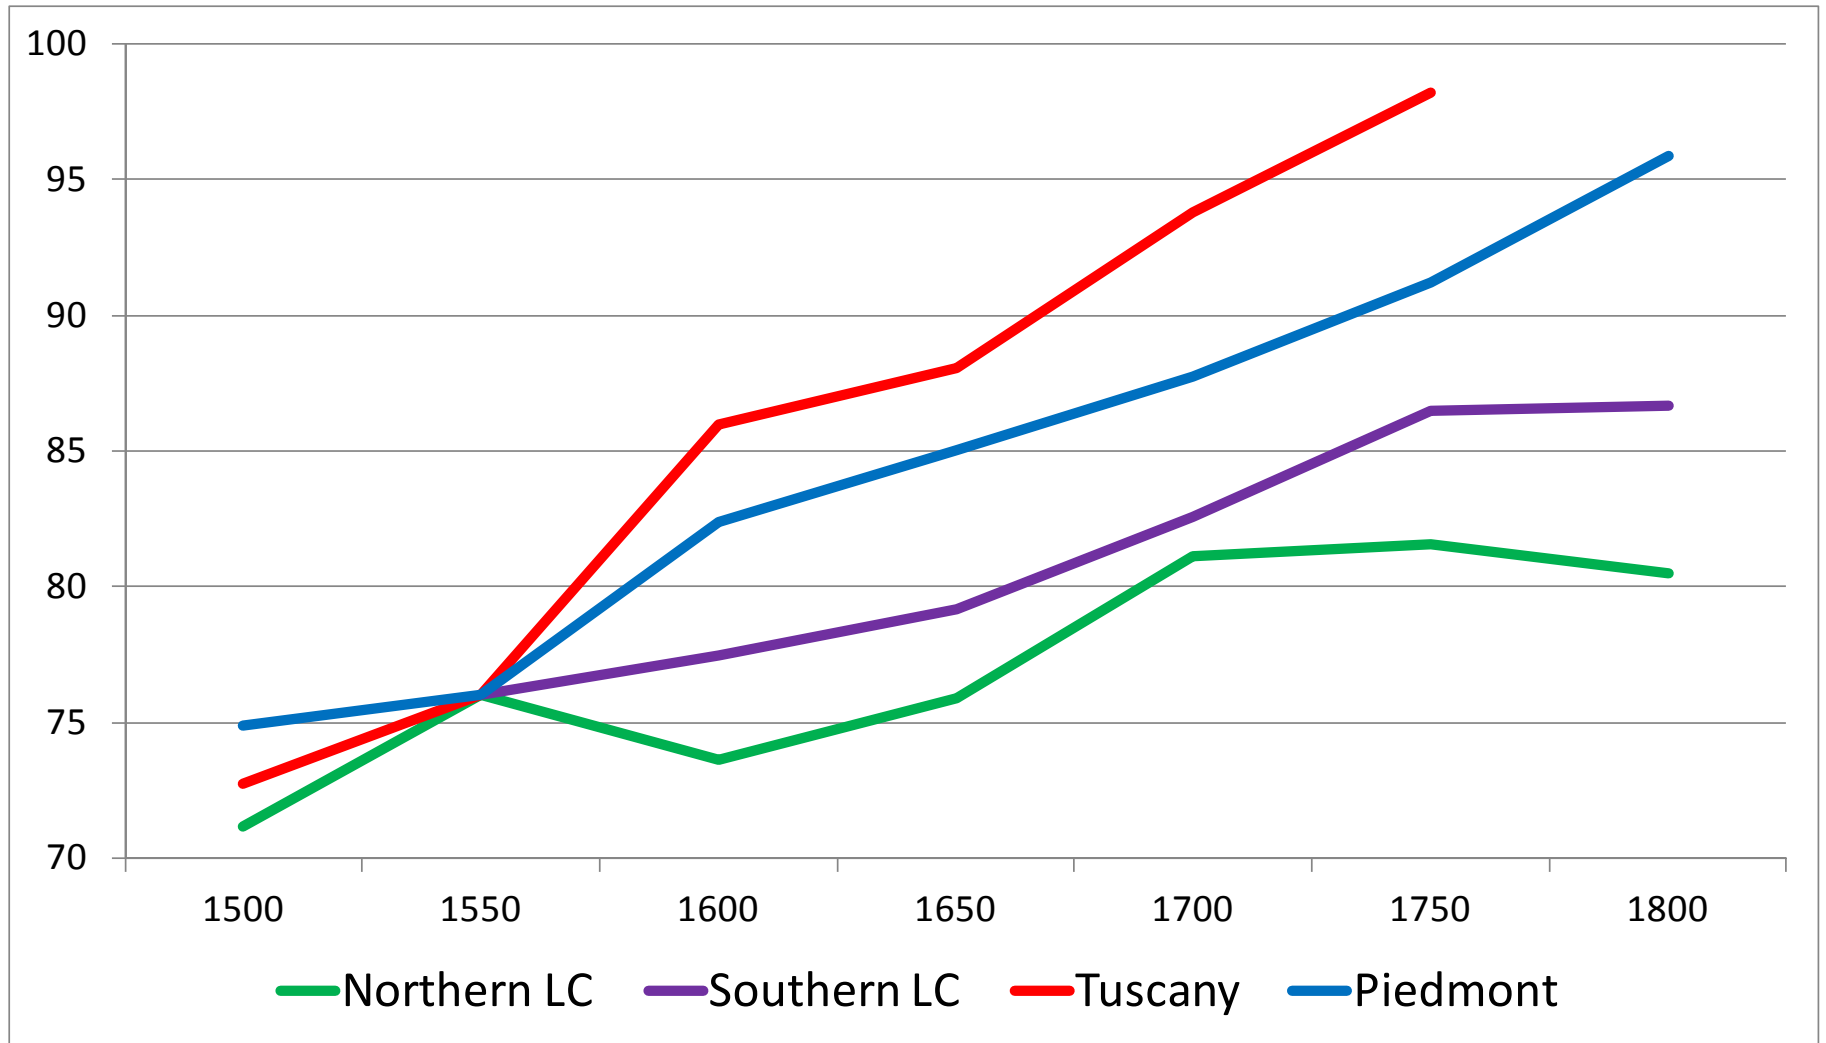

Converted Gini coefficients
(1550 = 76% extraction ratio, as in Northern Low Countries)

All cases

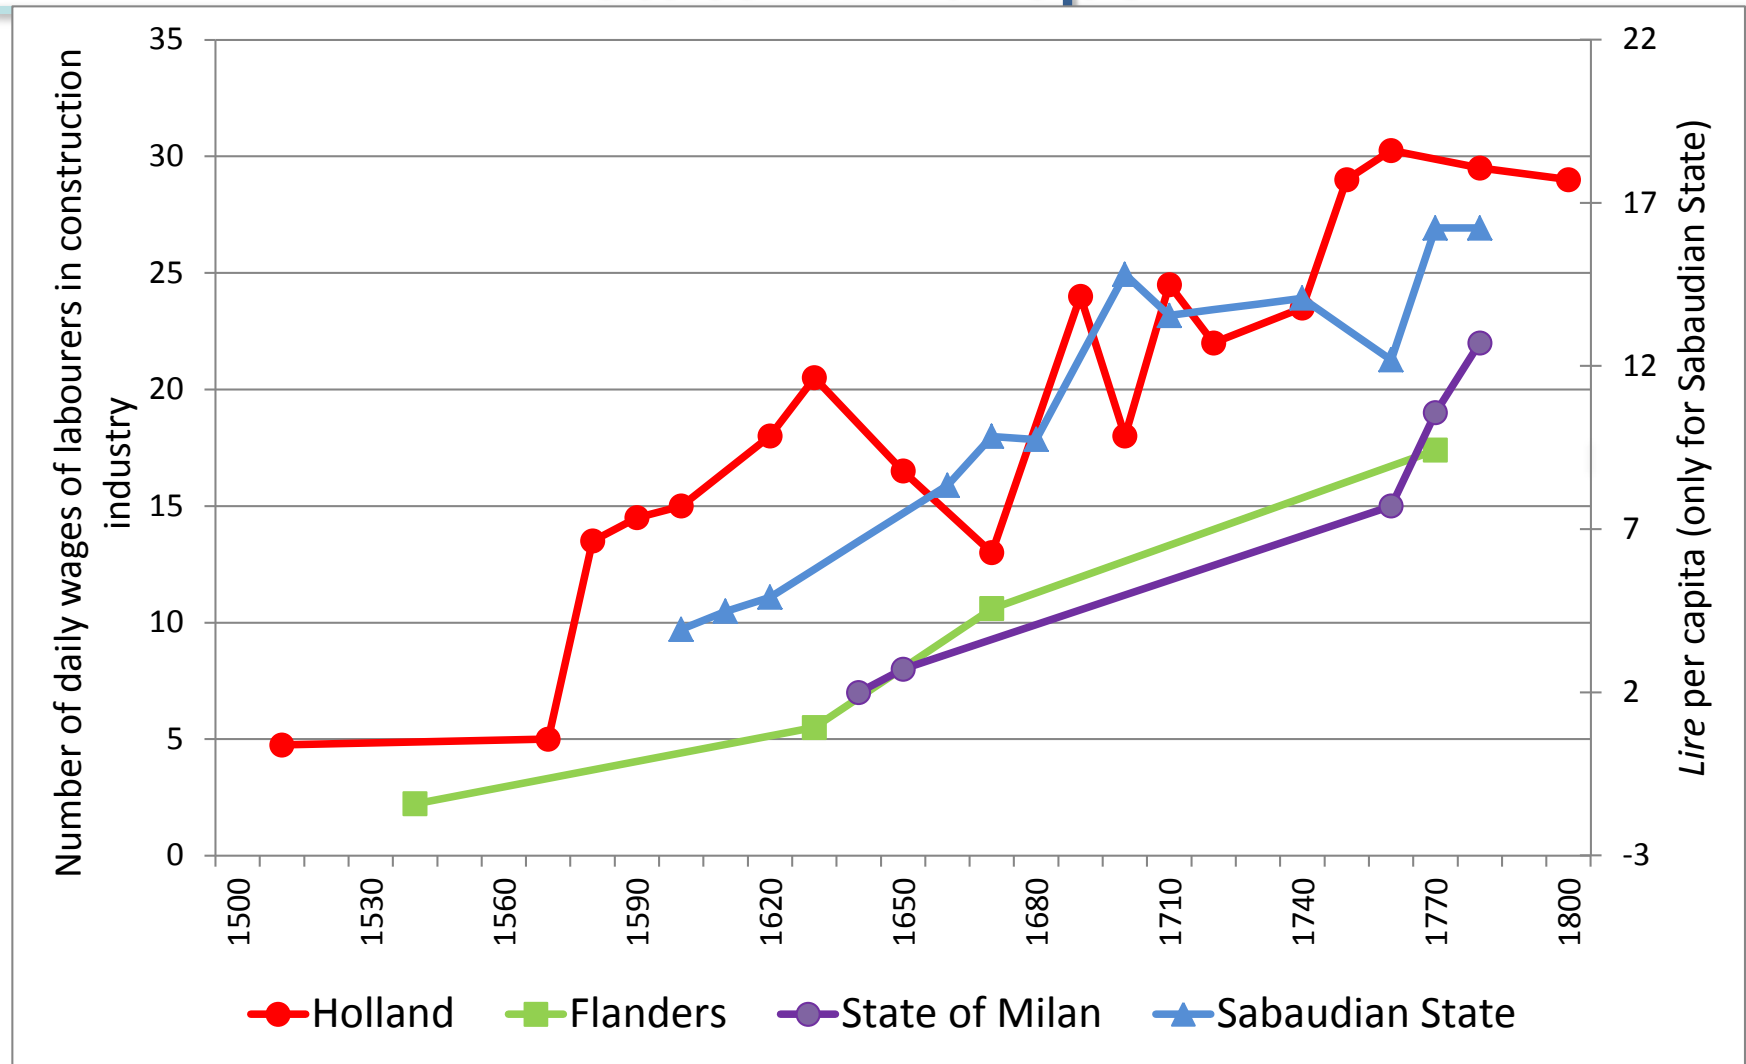

Converted Gini coefficients
(1550 = 76% extraction ratio)

Extraction ratios

Converted extraction ratios: 1550 = 76%

Increasing extraction and the rise of the fiscal state in Europe

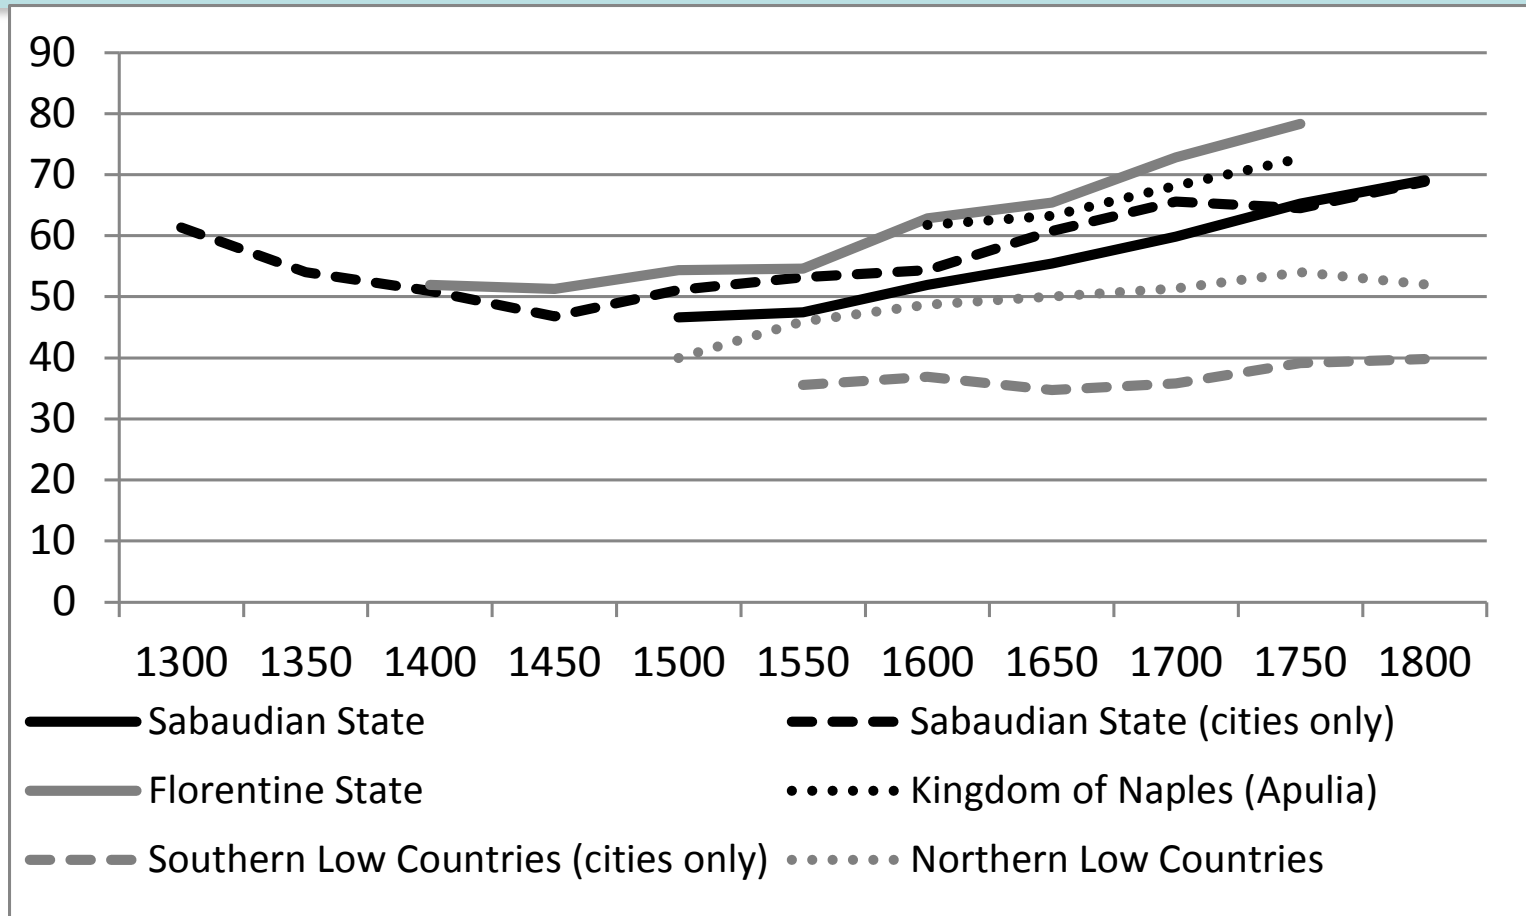

Increase in per-capita fiscal burden, ca. 1500-1800

Politics and institutions

- The fact that although inequality grew everywhere, trends in inequality extraction ratios differed deeply suggests to pay particular attention to political and institutional factors.
- **The rise of the fiscal-military state:**
 - **Growth of regressive fiscal pressure**
Relative exception: Dutch Republic
 - **Inegalitarian Redistribution through interest payments & warfare**
And in the opposite direction: poor relief (2016 article by Van Bavel and Rijma, suggesting differences in levels of “social spending” across preindustrial Europe)
- **Processes of “proletarianization”**

The share of the top 10%

In Italy, where the figures refer to wealth (in the Low Countries they refer to income), for 1800 we found shares of the top 10% very close to those proposed by Piketty (2014) for Europe in 1810: about 80%

Connecting to the present: the share of wealth of the top 10% in Europe, 1300-today
